Vital Signs Monitoring Program

An Innovative System to Monitor Clients with Chronic Diseases

Save time and money and reduce your number of unnecessary hospital visits by monitoring a wide range of chronic illnesses from the comfort of home!

 Diabetes, Congestive Heart Failure,
Hypertension, COPD and more.

With our exclusive monitoring units, you can easily measure glucose, blood pressure, pulse and weight every day at your convenience without leaving home. A trained Home Helpers healthcare professional can also perform these services if you choose.

No Worrying About:

- Managing chronic illnesses
- Reporting accurate & ever-changing numbers to clinicians
- Repeat hospital stays

Direct Link's monitoring program ensures that the client gets the help that they need.

How it works...

- 1 Direct Link installs a convenient, easy to use modem in the client's home. The modem plugs into a telephone jack.
- 2 The client takes their vital signs and, with the touch of a button, the modem sends the readings to Direct Link.
- 3 Our team of Care Center representatives and clinicians monitor the client's vitals.

If our systems determine that the client's vital signs are not in line with the expectations set in the Care Plan, we contact the client, ensure they are OK, and contact clinical professionals to triage the client, thus helping them avoid hospitalization.
- 4 If we do not receive a client's vital signs within the specific time frame, as documented in their Care Plan, we call the client and give them a reminder to take their vitals.

We then follow up as necessary with families or health care professionals.
